## Test Report

RIVERBANK.ALIONSCIENCE.COM FOUNDED 1918 BY

WALLACE CLEMENT SABINE

SPONSOR: EUREKA

Montréal, QC, Canada

CONDUCTED: 2020-09-30

ON: 4821-36 HEX AREA (2x4 square array, 45 in. on center)

#### TEST METHODOLOGY

Riverbank Acoustical Laboratories<sup>™</sup> is accredited by the U.S. Department of Commerce, National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP) as an ISO 17025:2017 Laboratory (NVLAP Lab Code: 100227-0) and for this test procedure. The test reported in this document conformed explicitly with ASTM C423-17: "Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method." The specimen mounting was performed according to ASTM E795-16: "Standard Practices for Mounting Test Specimens During Sound Absorption Tests." A description of the measurement procedure and room specifications are available upon request. The results presented in this report apply to the sample as received from the test sponsor. Montréal, QC, Canada

## INFORMATION PROVIDED BY SPONSOR

The test specimen was designated by the sponsor as 4821-36 HEX AREA (2x4 square array, 45 in. on center). The following nominal product information was provided by the sponsor prior to testing. The accuracy of such sponsor-provided information can affect the validity of the test results.

#### **Product Under Test**

Trade Name:	HEX AREA
Product ID:	4821-36
Manufacturer:	EUREKA

## SPECIMEN MEASUREMENTS & TEST CONDITIONS

Through a full external visual inspection performed on the test specimen, Riverbank personnel verified the following information:

#### **Test Specimen**

Materials:	Enclosed aluminum fixtures with semirigid felt panel on one face
Geometry:	Regular hexagonal prisms (8)
	Side length @ 469.9 mm (18.5 in.)
	Depth @ 95.25 mm (3.75 in.)
Overall Weight:	79.83 kg (176 lbs)

INVERBANK ACOUSTICAL LABORATORIES IS ACCREDITED BY NVLAP (LAB CODE 100227-0) FOR ACOUSTICAL TESTING SERVICES IN ACCORDANCE WITH ISO/IEC 17025:2017 AND FOR THIS PROCEDURE. THIS REPORT MUST NOT BE USED BY THE CLIENT TO CLAIM PRODUCT CERTIFICATION, APPROVAL, OR ENDORSEMENT BY RAL, NVLAP, NIST, OR ANY AGENCY OF THE U.S. GOVERNMENT. THIS REPORT SHALL NOT BE MODIFIED WITHOUT THE WRITTEN APPROVAL OF RAL. THE RESULTS REPORTED APPLY ONLY TO THE SPECIFIC SAMPLE SUBMITTED FOR TESTING; RAL ASSUMES NO RESPONSIBILITY FOR THE PERFORMANCE OF ANY OTHER SAMPLE.

Physical Measurements (per obje	ct)
---------------------------------	-----

Dimensions: 0.8 m (31.682 in) wide by 0.93 m (36.5 in) long Thickness: 0.1 m (3.75 in) Weight: 9.98 kg (22.0 lbs)

## **Test Environment**

Room Volume:	291.98 m <sup>3</sup>
Temperature:	22.4 °C $\pm$ 0.0 °C (Requirement: $\geq$ 10 °C and $\leq$ 5 °C change)
<b>Relative Humidity:</b>	56.7 % $\pm$ 1.2 % (Requirement: $\geq$ 40 % and $\leq$ 5 % change)
<b>Barometric Pressure:</b>	98.0 kPa (Requirement not defined)

Each sound absorbing object had an absorptive area (all exposed surfaces) of  $1.42 \text{ m}^2$  (15.24 ft<sup>2</sup>). The total absorptive area (all exposed surfaces) of all sound-absorbing objects was  $11.33 \text{ m}^2$  (121.92 ft<sup>2</sup>). The array of objects covered 8.52 m<sup>2</sup> (91.67 ft<sup>2</sup>) of the horizontal test surface (total treated area).

#### MOUNTING METHOD

Type J Mounting: The specimen is an array of 8 spaced sound absorbing objects suspended from cables such that the closest face is located approximately 0.91 m (36 in.) from the horizontal test surface. This approximates the mounting method of a typical ceiling baffle installation. The objects were evenly distributed a 2x4 square array, spaced 1143 mm (45 in.) on center.

#### Appendix D to ASTM C423 Sound Absorption Test

Non-standard calculation of equivalent NRC Rating and Absorption Coefficients from spaced absorbers

At this time ASTM C423 does not provide a standard method for determining absorption coefficients of spaced object absorbers. Tests of a set of sound absorbing objects spaced apart from each other will yield higher absorption rates than a specimen joined together as a single patch (A-Mount or E-Mount). For this reason it is unfair to provide NRC or absorption coefficient ratings for specimens that consist of a spaced set of absorbers. Despite this, the architectural industry has expressed great demand for a simple "single number" rating for these treatments. Likewise, acoustical consultants desire equivalent absorption coefficient data for use in acoustical modeling software. The following is an attempt to appease these demands until ASTM develops a standard method for calculation. Several alternate non-standard calculation methods are provided. Riverbank Acoustical Laboratories prefers method 1.

#### Method 1) Apparent Sound Absorption Coefficient calculated from total test surface area covered

The total sound absorption yielded by the specimen is divided by the total surface area of the test surface covered by the suspended objects, including intermediate spaces. The object rigging covered 8.52 m<sup>2</sup> (91.67 ft<sup>2</sup>) of horizontal test surface area. With an extra 215.9 mm (8.5 in.) of width and length to account for the space between the tested array and what would be the next object in a larger array, the surface area comes to 9.93 m<sup>2</sup> (106.86 ft<sup>2</sup>). Apparent Noise Reduction Coefficient (NRC) rating and Sound Absorption Average (SAA) figures are calculated from this data based on the methods described in ASTM C423-17. This may be the most accurate method for comparing object arrays to ceiling tile products. The apparent sound absorption coefficient data can be assigned to a single horizontal surface or plane in acoustical modeling software for approximation of object array performance. Such approximations rely on the assumptions that object spacing is similar to that of the tested array across the entire surface and that the installation occurs over a perfectly reflective surface material.

**Method 2)** Apparent Sound Absorption Coefficient calculated from total exposed surface area of specimen The total sound absorption yielded by the specimen is divided by the total surface area of all exposed specimen faces (1.42 m<sup>2</sup> (15.24 ft<sup>2</sup>) per object x 8 objects = 11.33 m<sup>2</sup> (121.92 ft<sup>2</sup>) total surface area). Apparent Noise Reduction Coefficient (NRC) rating and Sound Absorption Average (SAA) figures are calculated from this data based on the methods described in ASTM C423-17. This method shows the actual absorption occurring at the exposed surfaces, but does not provide a fair comparison with materials mounted as a uniform patch (in A-mount or E-mount).
